Drags, Terms and Graphs

- Drags are a generalization of terms
- Drags are a special kind of labelled graphs with variables

Confluence of Graph Rewriting

- Confluence for terminating graph rewriting systems is undecidable [Plump 1993]

Confluence of Graph Rewriting

- Confluence for terminating graph rewriting systems is undecidable [Plump 1993]
- Confluence for terminating graph rewriting systems with interfaces is decidable [Bonchi et al 2017]

Drags

We presuppose two sets Σ (function symbols) and Ξ (variables) whose elements have a fixed arity. Variables have arity 0.

Definition

A *drag* is a tuple $\langle V, R, S, L, X \rangle$, where

- 1 V is the finite set of *vertices*;
- 2 $R : [1..|R|] \rightarrow V$ is a finite list of vertices, called *roots*;
- 3 $S \subseteq V$ is the set of *sprouts*, $V \setminus S$ is the set of *internal* vertices;
- 4 $L : V \rightarrow \Sigma \cup \Xi$ is the *labeling* function, mapping internal vertices to labels from the vocabulary Σ and sprouts to labels from the vocabulary Ξ ;
- 5 $X : V \rightarrow V^*$ is the *successor* function, mapping each vertex $v \in V$ to a list of vertices in V such that $|X(v)| = |L(v)|$.

Drag Composition uses a Switchboard

Definition

Let $D = \langle V, R, L, X, S \rangle$ and $D' = \langle V', R', L', X', S' \rangle$ be drags. A *switchboard* ξ for (D, D') is a pair $\langle \xi_D : S \rightarrow [1 .. |R'|], \xi_{D'} : S' \rightarrow [1 .. |R|] \rangle$ of partial injective functions (we also say that (D', ξ) is an *extension* of D), such that

- (i) $\forall s, t \in S$ such that $s \in \mathcal{D} \Downarrow_{\xi_D}$ and $L(s) = L(t)$, then $t \in \mathcal{D} \Downarrow_{\xi_D}$ and $R'(\xi_D(s)) = R'(\xi_D(t))$;
- (ii) $\forall s, t \in S'$ such that $s \in \mathcal{D} \Downarrow_{\xi_D}$ and $L'(s) = L'(t)$, then $t \in \mathcal{D} \Downarrow_{\xi_D}$ and $R(\xi_{D'}(s)) = R(\xi_{D'}(t))$;
- (iii) ξ^* does not induce cycles among the sprouts of the two drags.

Rewriting Switchboard

Definition (Rewriting switchboard and extension)

ξ is a *rewriting switchboard* for (D, L) if

- ξ_D is linear and *surjective* (all roots of L must disappear)
- ξ_L is *total* (all sprouts must disappear)

(D, ξ) is called a *rewriting extension* of L .

Examples of composition

$$\begin{array}{ccc} \downarrow & & \downarrow \\ f & \otimes_{\{x \mapsto 1\}} & f \\ \downarrow & & \downarrow \\ x & & y \end{array} = \begin{array}{c} \downarrow \\ f \\ \downarrow \\ f \\ \downarrow \\ y \end{array}$$

Substitution

Examples of composition

$$\begin{array}{c} \downarrow \\ f \\ \downarrow \\ x \end{array} \otimes_{\{x \mapsto 1\}} \begin{array}{c} \downarrow \\ f \\ \downarrow \\ y \end{array} = \begin{array}{c} \downarrow \\ f \\ \downarrow \\ f \\ \downarrow \\ y \end{array}$$

Substitution

$$\begin{array}{c} \downarrow \downarrow \\ f \\ \swarrow \searrow \\ x \quad x \end{array} \otimes_{\{x \mapsto 1, y \mapsto 2\}} \begin{array}{c} \downarrow \\ g \\ \downarrow \\ y \end{array} = \begin{array}{c} \downarrow \\ f \\ \downarrow \downarrow \\ g \end{array}$$

Forced sharing: a choice

Examples of composition

$$\begin{array}{c} \downarrow \\ f \\ \downarrow \\ x \end{array} \otimes_{\{x \mapsto 1\}} \begin{array}{c} \downarrow \\ f \\ \downarrow \\ y \end{array} = \begin{array}{c} \downarrow \\ f \\ \downarrow \\ f \\ \downarrow \\ y \end{array}$$

Substitution

$$\begin{array}{c} \downarrow \downarrow \\ f \\ \swarrow \searrow \\ x \quad x \end{array} \otimes_{\{x \mapsto 1, y \mapsto 2\}} \begin{array}{c} \downarrow \\ g \\ \downarrow \\ y \end{array} = \begin{array}{c} \downarrow \\ f \\ \downarrow \downarrow \\ g \end{array}$$

Forced sharing: a choice

$$\begin{array}{c} 1 \quad 2 \\ \downarrow \quad \downarrow \\ f \quad f \\ \swarrow \quad \searrow \\ \quad \downarrow \\ \quad x \end{array} \otimes_{\{x \mapsto 1\}} \begin{array}{c} 1, 2 \\ \downarrow \\ a \end{array} = \begin{array}{c} 1 \quad 2 \\ \downarrow \quad \downarrow \\ f \quad f \\ \swarrow \quad \searrow \\ \quad \downarrow \\ \quad a \end{array}$$

Drag unification versus tree unification

Drag unification versus tree unification

=

σ is a unifier of D and D'

Drag unification versus tree unification

Drag unification versus tree unification

C is a unifier of U and V

Definition

Given

- two drags U, V that share no vertex names nor root numbers,
 - two lists of internal *partner vertices* $\bar{u} \in U, \bar{v} \in V$ of equal length,
- the *unification problem* $U[\bar{u}] = V[\bar{v}]$ admits as *solutions* or *unifiers*, the common extensions of both U and V which identify $U \otimes_{\xi} C$ and $V \otimes_{\xi} C$ below \bar{u} and \bar{v} respectively, that is, the subdrags of $U \otimes_{\xi} C$ at \bar{u} and of $V \otimes_{\xi} C$ at \bar{v} must be isomorphic, that is, identical up to vertex names.

Subsumption

Definition

We say that a drag U subsumes a drag V if there is a context extension (C, ξ) of U such that $V = C \otimes_{\xi} U$.

Lemma

Subsumption is a quasi-order whose equivalence is variable renaming, and strict-part is well-founded.

Subsumption extends naturally to context extensions. Given a set of unifiers, its minimal elements are said to be *most-general*.

Theorem

A solvable unification problem has a most general unifying extension computable in quadratic time and linear space.

Lemma (Commutation)

Assume that $U = V \otimes_{\xi} W$, $V \xrightarrow[L \rightarrow R]{} V'$ and $W \xrightarrow[G \rightarrow D]{} W'$. Then:

Lemma

Let $S \begin{array}{c} \longleftarrow U \longrightarrow \\ \text{L} \rightarrow \text{R} \quad \text{G} \rightarrow \text{D} \end{array} T$, and let us assume that U has an internal vertex w which is an internal vertex of both L and G . Then, there exist $\bar{u} \in \text{Ver}(L)$ and $\bar{v} \in \text{Ver}(G)$, and a unifying extension $\langle E, \zeta \rangle$ of the equation $L[\bar{u}] = G[\bar{v}]$ such that $U = L \otimes_{\zeta} E = G \otimes_{\zeta} E$.

Confluence reduces to critical pairs joinability

Definition (Critical pair)

Let $L \rightarrow R$ and $G \rightarrow D$ be two rules that are unifiable at partner vertices \bar{v}, \bar{w} , and $\langle C, \xi \rangle$ be an mgu. Then, $\langle L \otimes_{\xi} C, G \otimes_{\xi} C \rangle$ is called a *critical pair* of $L, G \rightarrow D$ at \bar{v}, \bar{w} .

Theorem

Let S be a terminating rewrite system on drags. Then, S is confluent iff all its critical pairs are joinable.

Achievements and Problems

- A rich algebra of drags based on COMPOSITION that provides a natural definition of rewriting

Dershowitz&Jouannaud, TCS, 2019

- A rewrite ordering ordering over drags (wich is total up to permutation of roots)

Dershowitz&Jouannaud, LPAR, 2018

- Drag unification is unitary (with quadratic complexity)

Jouannaud&Orejas, UNIF, 2020

- Confluence of drag rewriting reduces to critical pairs joinability

Jouannaud&Orejas, IWC, 2020

- Graph Rewriting versus Drag Rewriting

Dershowitz, Jouannaud&Orejas, Draft, 2020

- **Applications:** logic programming, cyclic lambda-calculus, Koszul's completion of operads, etc.
